In this scenario we execute the gateway with different configurations selected. The output file is deleted first, then regenerated, and then checked about the file size. We are not yet looking into the file itself (to check the content), although also this would be possible.

1. Initialization - Find Items already in Integrity

Search for the project item with Summary "Project for Release 1" and return the ID, lookup also the Test Objective previously created.

Integrity	localhost:7001					
Type	Summary	Text	State	find Item?	Value?	
Project	Project for Release 1			\$IDP<-[101]	101>0	
Test Objective	System and Interface testing			\$IDTO<-[609]	609>0	

2. Integrity Gateway Tests with Custom Code and Word Files

Run the gateway and create output files. Check the generated filesize.
